

RedFrog BioTimeClock™

Finger Print Time Clock Software

The easy to use, hard to fool, time clock system.

You'll Never Use Punch Cards Again!

BioTimeClock runs on a simple inexpensive Windows 2000 or XP system and handles hundreds of users. Each user (an employee in most cases) clocks in and out by entering a 2 or 3 digit numeric code and then pressing their finger (any finger that was registered) against the fingerprint reader.

The reader works with fairly dirty fingers and is suitable for manufacturing locations.

Since the employee must be present to make the entry, other people can not make the entry as a favor.

Fingerprint Punch in/out

You can't fool the BioTimeClock system. Each clock-in and clock-out is based on the combination of a 3 digit code *and* the fingerprint reading.

Secure user fingerprints

BTC does not store a picture of the fingerprint. It only keeps significant points that it records in the initial registration. Your users do not have to worry about their fingerprints being copied.

Easy to install and set up

The system installs easily. The reader works from a regular USB port. Only the reader, keyboard and monitor need to be exposed. We have heavy duty factory grade computers, monitors and keyboards available for different requirements.

Comprehensive Software

You can schedule employees on multiple shifts for multiple job classifications. Many people will buy the program to obtain the functionality of the software alone!

Networkable

Any combination of 5 users can work together on a Local Area Network (LAN). Up to 4 of those users may be administrative users than can access the database to view information and run reports. If you need more users, a network expansion license is available at extra cost.

We're the developers

We are the developers and publishers of this software package. You will be working directly with the people that created the application and wrote the code. We are very responsive to our users and we are here to support you. Should you need changes or additions to the software, we can do so at our current development rates.

Easy set up

Add user names and information, the pay period used and rates. Then have each user step up to the reader to record their initial print (the unit averages 3 readings). Any finger may be used.

- Schedules multiple shifts
- Handles assigned breaks
- Reports specified out-of-range settings
- Prints out reports
- Handles hundreds of employees

Reporting

Use paper reports for time, salary and payroll reporting and obtain exception reports and printed schedules. Each user may also request a clock-in/out receipt if you use a 40 col. ticket printer.

Requirements

We provide the software and the reader. You provide an IBM compatible PC that can run Windows 2000 or Windows XP. You do not need a powerful PC for this application. A small hard drive will work well. You will need a network card if you want to read the data and generate reports from a different PC.
